Annual AB 2588 Hot Spots Program Report

Contents

Executive Summary

1. Introduction
2. AB 2588 – “Hot Spots Program”
3. District Rules and Procedures
4. District Program Implementation
5. Prioritization and Trends in 2025
6. PCBTF Special Attention
7. Control Strategy and Program Enhancements
8. Conclusion

Appendix A Prioritization Scores for **Title V** (Major Source)

Appendix B Prioritization Scores for **Commercial Gas Stations**

Appendix C Prioritization Scores of **Zero** Inventory

Appendix D Prioritization Scores of **Low** Inventory

Appendix E Prioritization Scores of **Intermediate** Inventory

Executive Summary

The Hot Spots program requires air districts to assign risk prioritization scores based on a cancer risk assessment for permitted facilities. Facilities that score "**low**" have no program requirements (de minimis level risk); facilities that score "**intermediate**" must provide emission inventory updates every four years for ongoing evaluation; and facilities that score "**high**" must perform a Health Risk Assessment, provide public notice, install Best Available Control Technology to reduce risk, and undergo risk reduction audits. Facilities identified as "**zero**" have no estimated toxic emissions.

Facilities with low prioritization scores constitute the bulk of the District's permits. AB 2588 does not require facilities with low prioritization scores to recalculate their historical risk assessments unless they modify their permits or become intermediate risk facilities which must recalculate their emissions inventory and risk every four years with current methodology. All District Title V (major source) facilities, commercial gasoline stations, and new permits utilize current methodologies, and conversely the District has many older permits that have not been modified in their lifetime.

Of special the note, the District has added a new discussion in Section 6 of this report regarding "PCBTF" or para-chlorobenzotrifluoride which is a toxic used widely by paint and coating industries. The District has ten facilities in its inventory that utilize PTCBF. Recently, the PCBTF exposure value was substantially increased with significant implications for public health and industry that are yet to be resolved and is a rapidly evolving statewide issue. PCBTF projects require increased awareness and scrutiny.

The Hot Spots report is updated and issued on an annual basis and evolves as new facilities are permitted; existing facilities undergo permit modifications; as new evaluation tools are created and state reporting requirements are revised; as new toxics are identified; and as existing toxics characteristics are updated. The reader is encouraged to reach out to the District with any specific questions.

For the 2025 inventory, the facility prioritization risk scores and counts trend as follows:

Risk Level	Facility Count	Cancer Risk in 1 million
High	**0**	≥ 10
Intermediate	**22**	≥1 and <10
Low	**402**	<1
Zero (no toxics)	**45**	0

1. Introduction

The Northern Sonoma County Air Pollution Control District (NSCAPCD) is 1 of 35 state-formed air pollution control agencies that regulates and permits stationary sources of ambient air pollution, for listed criteria and toxic pollutants. The California Air Resources Board (CARB) regulates mobile and portable sources and greenhouse gases.

The NSCAPCD jurisdiction is the west-northwest areas of Sonoma County. See our District web site with our territory map at: www.nosocoair.ca.gov . This report only covers the NSCAPCD jurisdiction; for southern Sonoma County we refer the reader to the Bay Area Air Quality Management District at www.baaqmd.gov .

The Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588) is a State of California public right-to-know law requiring local air quality management and air pollution control districts to collect information about the location, type, and quantity of toxic compounds emitted into the air from specified local businesses and industry.

This AB 2588 Program Annual Report is published to provide the public with information regarding the AB 2588 Program of the NSCAPCD. The enabling statutes (California Health & Safety Code (HSC) §44300-44394) require the California Air Resources Board (CARB) and local air districts to implement the "Hot Spots" Program. This report describes the current reporting and evaluation status for facilities being tracked under this program and is required by California HSC §44363.

---

2. AB 2588 - "Hot Spots" Program

Assembly Bill (AB) 2588 (Connelly), the Air Toxics "Hot Spots" Information and Assessment Act (Act) was promulgated in 1987 and requires air pollution control districts to prioritize facilities to determine which facilities must perform a health risk assessment. These facilities, for purposes of risk assessment, are ranked into "high", "intermediate", and "low" priority categories.

The primary goals of the Air Toxics "Hot Spots" program are to:

1) Collect air toxics emission inventories from facilities subject to the program.
2) Determine if these emissions are causing localized impacts high enough to expose individuals or population groups to significant health risks.
3) Notify nearby individuals or population groups if there are significant health risks.
4) Require those "high" level facilities to reduce the health risks below the significance level.

Under the Hot Spots program, applicable facilities are assigned a prioritization score based on cancer risk assessments. Cancer risk assessments rate an individual's likeliness of developing cancer among 1 million persons, based on their exposure to a toxic chemical(s).

Each District is responsible for establishing the **prioritization score** threshold at which facilities are required to prepare a health risk assessment. In establishing priorities, the Districts are to consider the potency, toxicity, quantity, and volume of hazardous materials released from the facility, the proximity of the facility to potential receptors, and any other factors that the District determines may indicate that the facility may pose a significant risk. Below are the NSCAPCD's risk prioritization scores.

Prioritization Scores NSCAPCD Regulation 1, Rule 225.5.2.A		
	Cancer Score	**Non-Cancer Score**
Low Priority	<1	<1
Intermediate Priority	≥1 and <10	≥1 and <10
High Priority	≥10	≥10

The Act requires facilities found to have a significant risk from their emissions to notify all exposed persons. Facility operators must notify all exposed persons of the risk assessment results if the District determines that there is a potentially significant health risk associated with emissions from the facility. Each District is responsible for establishing the **notification threshold** at which facilities are required to notify all exposed persons with either a letter to individual neighbors, or with a newspaper notification. Below are the NSCAPCD's notification thresholds.

Notification Threshold NSCAPCD Regulation 1, Rule 225.5.2.B		
	Cancer Score	**Non-Cancer Score**
	≥10	≥10

The Act requires facilities which are determined to present a significant risk to conduct a toxic risk reduction audit and develop a plan to implement measures to reduce that risk. Each District is responsible for establishing the risk value at which facilities must conduct a **risk reduction audit and plan**. CARB offers support for small and medium sized businesses to assist them in their efforts to reduce their toxic emissions and risk. Below is the NSCAPCD's risk reduction and audit plan thresholds.

Risk Reduction and Audit Plan NSCAPCD Regulation 1, Rule 225.5.2.C		
	Cancer Score	**Non-Cancer Score**
	≥100	≥10

3. District Rule and Procedures

Under the Hot Spots Program, permitted facilities which have the potential to emit toxic pollutants (toxics may also be referred to as "hazardous air pollutants" or "HAPs") are reviewed when permit applications are submitted to the District. The toxics for review are listed by the Office of Environmental Health Hazard Assessment (OEHHA) and CARB and is comprised of over 140 toxic substances.

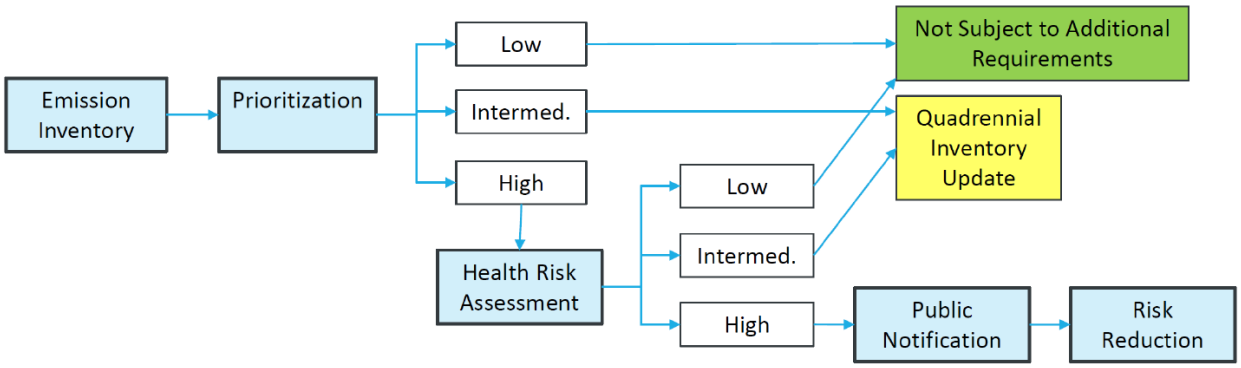

NSCAPCD Regulation 1, Rule 200 requires that an Authority to Construct permit must be obtained for a source that has the potential to emit a regulated air pollutant, including toxic pollutants. In this manner, no equipment at a facility that might emit air pollutants is allowed to be constructed or operated without first receiving District review and permits. If a new, reconstructed, or modified facility has the potential to emit a listed toxic pollutant, it is considered a "project" under the District's Hot Spots Rule: NSCAPCD Regulation 1, Rule 225. This District rule explains the District's toxics review procedures and program requirements in detail.

The District begins a Hot Spots review by using a screen to evaluate if the facility has a "low" prioritization score (<1). If the score is >1, standard risk calculations are performed to rank facilities as "intermediate" (≥1 and <10); or "high" (≥10). Facilities prioritized as "low" drop out of the program and are not subject to additional requirements. HSC §44344.4(a). Facilities identified as "intermediate" are required to provide quadrennial emission inventory updates to the District; are required to install Reasonable Control Technology (RCT) on the project, and may be required by the District to perform a detailed Health Risk Assessment. Facilities that are identified as "high" must perform a detailed Health Risk Assessment, install Best Available Control Technology for Toxics (TBACT); perform public notification; and undergo risk reduction

and audits. For high risk facilities, the health risk assessments are then reviewed and approved by both District staff and the (California) Office of Environmental Health Hazard Assessment (OEHHA) staff.

Under NSCAPCD rules, no person may construct, reconstruct, or modify a source of toxic or hazardous air pollutant emissions if such emissions may result in "unacceptable risk" to the public. Unacceptable risk is defined as any maximum individual cancer risk equal to or greater than 100 per million or any hazard index greater than 10 unless exempted by the Air Pollution Control Officer.

Facilities ranked as a "high" priority facility are required to perform a Health Risk Assessment which utilizes more precise and localized air dispersion modelling to calculate risk and to calculate a new prioritization score. This new prioritization score might be different from the original calculated prioritization score of "high" as the Health Risk Assessment methodology utilizes air dispersion modeling that is more precise and localized than the initial screening and calculation methods. The prioritization process is illustrated below:

4. District Program Implementation

The Hot Spots rule (HSC §44302-44394) was promulgated in 1987, and the Program begins with requirements that the Districts perform extensive industry surveys and permit review to prioritize all known existing facilities by December 1990. After these surveys were completed, the Districts continued to review facilities through their Authority to Construct permitting processes and District rules, going forward to present day.

Over time, the inventory has changed in a variety of ways. Some facilities that were previously ranked as "intermediate" became "low" priority sites with the introduction of new emissions control technologies; new alternative processes and non-toxic chemical substitutions that displaced toxic chemicals, such as the discontinuation of perchloride at dry cleaners; new water-based paints and finishes that replaced older toxic coatings; and cleaner, more refined gasoline specifications for less toxic vapors from gasoline dispensing facilities.

In contrast, some facilities that are/were previously prioritized as "low" or "intermediate" may elevate to a higher risk for a variety of reasons including: increases in production and/or change in production materials; updates in risk modelling algorithms that are more protective of public health; identification of new toxics in an existing industry sector; and re-evaluation of the cancer risk values of listed toxic substances.

Northern Sonoma County has also seen a shift in its economy in recent years as tourism and grape growing have become a more dominant part of the local economy that drives local land use. Industrial facilities that have historically utilized more toxic chemicals have waned, or been displaced altogether, including facilities such as manufacturing, lumber mills, wood kilns, aggregate and asphalt plants, and bulk oil facilities.

---

5. Prioritization and Trends in 2025

For 2025, the NSCAPCD permit inventory remained similar to previous years with approximately **(969)** permits, at **(252)** facilities, operated by **(166)** companies.

A savvy reader will notice that the District has many more permits than facilities, and this is correct and by design. The District's permit system is structured in a manner that one facility can have multiple permits. This is an EPA-approved District program element useful for permitting the geothermal industry which is the predominant industry sector in the District. Permitting a geothermal plant is complex as the 'fuel' is an underground steam field spreading across miles of land. While the turbine is the main power source, the steam naturally vents or escapes through dozens of wellheads, support systems, and drilling sites. We are not permitting a single point; but

rather an entire geographic network driven by a single natural resource. When toxic risk is modeled for each of the District's Title V facilities, it is performed for each facility with the aggregate of all the equipment/permits at a given facility to achieve an accurate risk evaluation of each facility.

See Appendices C, D, and E for lists of the permits and facilities with their prioritization score and their locations that are currently evaluated under the Hot Spots program. For the 2025 reporting year:

- **45** facilities with **0 toxics**.
- **402** facilities identified with a "**Low"** risk prioritization score.
- **22** facilities identified with an "**Intermediate"** risk prioritization score.
- **0** facilities identified with w "**High"** risk prioritization score.

Of note, the NSCAPCD does not have any: dry cleaners with perchlorate; crematoriums; fossil-fuel fired electrical generation units; (ink) print and graphics facilities; prime (non-emergency use) diesel engine-powered generators; and Healdsburg Hospital does not utilize Ethylene Oxide for sterilization. The electrical generation in the District territory does not utilize fossil fuels and is solely renewable energy; primarily geothermal.

INVENTORY OVERVIEW AND DISCUSSION

- **Title V ("Major Source") facilities**. All NSCAPCD Title V facilities have recent prioritization scores re-calculated on a quadrennial basis representative of operations with current emissions factors. Title V includes federal permit requirements for the District-issued operation permits for facilities that: emit 100 tons or more per year of a single criteria pollutant (NOx, SO2, Pb, VOC, CO, PM10, PM2.5); or 10 tons per year of a single hazardous air pollutant; or 25 tons of all hazardous air pollutants combined.

  For NSCAPCD, Title V sources are comprised of the Geysers Geothermal facilities located in the northeast of Sonoma County in the Mayacamas Mountains along the Sonoma and Lake County border. The Geysers is the world's largest geothermal field spanning an area of around 30 square miles, containing a complex of 18 geothermal plants, drawing steam from more than 350 wells and produces approximately 725 MW of power. These facilities include equipment such as steam turbines, diesel generators, direct contact steam condensers, cooling towers, condensate pumps, air compressors, dump tanks, abatement solutions, and caustic injection systems. Emissions from these facilities are primarily from natural occurring toxics and H_2S present in the dry geothermal steam. These facilities are

primarily located along a ridgeline a mile or more from nearby towns and are well isolated from the public.

The Geysers scores show that the **(2)** Northern California Power Agency (NCPA) and **(9)** Calpine facilities were ranked with "low" prioritization scores and **(1)** Calpine facility ranked with an "intermediate" prioritization score. Although these are larger facilities, they primarily scored low due to their isolated locations approximately a mile from each other and/or residences. **Please see Appendix A. for the prioritization scores of the Geysers Title V facilities.**

- **Commercial Gas Stations or "gasoline dispensing facilities" (GDF).** 2025 GDF prioritization scores were calculated with the 2022 California Air Resource Board (CARB) methodology that utilizes an inhalation-based calculation with updated emissions factors. This methodology has a more specific focus on the proximity of nearest residences, businesses, and areas where the public has access, and generally returns higher risk values than previous methods, especially for residences near GDFs (due to chronic exposure time). For 2025, the NSCAPCD had **(17)** permitted facilities and modeled them at their actual reported throughput levels (gallons sold for the year). GDF throughput rates fluctuate and therefore GDF data is collected and analyzed every year to keep track of potential changes in risk. The primary toxic of concern with gasoline is benzene.

  For the **(17)** GDFs, the risk prioritization scores show that **(10)** facilities scored "low" and **(7)** scored as "intermediate." These results demonstrate a public health and safety need to place intentional distance between GDFs and residences, due to the chronic exposure. **Please see Appendix B. for the prioritization scores of retail gas stations.**

- **Diesel Engines.** In 1998, CARB defined diesel particulate matter as a toxic air contaminant based on published evidence of a relationship between diesel exhaust exposure and lung cancer and other adverse health effects. On January 1, 2005, CARB established an Air Toxics Control Measure (ATCM) to regulate newly purchased and installed (a.k.a. "existing" or "in-use") stationary diesel engines (Title 17, California Code of Regulations, §93115.1 et. seq.). Amendments were added to the ATCM in 2007 and 2011.

  The NSCAPCD inventory of diesel engines only includes stationary diesel engine-powered emergency generators and agricultural diesel engines. The inventory does not include any "prime" generators for commercial power generation or for non-agricultural use that serves as a primary source of power for an extended period of time for non-emergency operations.

  As mentioned previously in this report, low prioritization score permits are removed from the AB 2588 program requirements until a permit modification or new project that would

trigger new permit review and new risk prioritization calculations with current methodology. Permitted diesel engines are unique in that they often don't modify their operational requirements, and the engines can operate for 20-30 years with proper maintenance. These low-use diesel engines will reach end of life by environmental decay and not by mechanical limits. Therefore, the NSCAPCD has many older engines in inventory that have old risk prioritization assessments with limited documentation to review methodology.

To address this, the District has preemptively begun to re-calculate risk prioritization on all of its diesel engine inventory with the most current methodology ("DICE" model). The District has completed approximately half of the inventory and anticipates completion and additional review in conjunction with Phase-3 of the CTR report.

In the 2025 inventory there are **(199)** emergency generators and **(134)** agricultural engines, including remote and low use agricultural engines.

- Emergency Engines
  In this context, an "Emergency" engine has a specific definition in state law. HSC § 935115.4(a)(30). It is defined as a loss of line power from a utility provider or the use of a fire pump during catastrophic conditions, which is different from a "backup" or "standby" engine. Emergency engines are not required to meet in-use emissions limits, but at the time of installation the units must be emissions certified to the applicable engine Tier pursuant to the ATCM. Emergency engines are permitted for maintenance and testing time only (usually 20-50 hours per year), and emergency use time is not regulated. Emergency engines are unique in the ATCM as they do not have a compliance schedule to phase out older Tier 0, 1, or 2 engines due to their limited, emergency use.

- Agricultural Engines
  An "agricultural engine" is specifically defined as a diesel engine rated greater than 50 HP used at an "agricultural operation." Agricultural operation is defined as the growing and harvesting of crops or the raising of fowls or animals for the primary purpose of making a profit, providing a livelihood or research by an educational institution. HSC §93115.4(a)(1). Excluded from this are agricultural wind machines; self-propelled equipment (e.g., tractors, harvesters, etc.); spark-ignited engines; and portable engines owned by a rental/leasing company. HSC §93115.2(a).

- Remotely Located Agricultural Engines
  A "remotely located agricultural engine" is a stationary diesel fueled engine rated greater than 50 HP used in agricultural operation that is: in a NAAQS attainment

area for PM and ozone and is located more than ½ mile from three or more permanent residences outside of the facility property. HSC §93115.4(a)(63). Excluded from this are agricultural wind machines; self-propelled equipment (e.g., tractors, harvesters, etc.); spark-ignited engines; and portable engines owned by a rental/leasing company. HSC §93115.2(a).

- Very Low Use (vineyard frost protection)
  Some local vineyards operate older Tier-0, 1, 2, or 3 diesel engine-powered water pumps for frost protection under a "low-use" permit exemption that strictly limits operation to 20 hours per year. Because premium winegrapes are only vulnerable during the brief spring budbreak window from mid-March to May, and radiation frost typically pools only in low-lying valley floors, many vineyards see nominal or no hours of average frost system use in a standard year but still want the insurance of frost protection for the crop's capital expenditure. This permit exemption allows for limited use rather than forcing immediate replacement of an older Tier engine and is an authority granted to the APCO under 17 CCR § 93115.8(c&d). However; an issued low-use permit cannot be expanded beyond 20 hours without being subject to current engine Tier requirements as a new project.

These four categories of emergency and agricultural engines typically have low prioritization scores due to limited use of 20-50 hours per year for emergency engines; remote locations; locations on a large agricultural property without nearby neighbors or public; or very low use for frost protection events. These conditions and older arithmetic-based models typically returned a low prioritization risk score.

In recent years, the NSCAPCD began preemptively recalculating diesel engine risk scores with CARB's recommended "DICE" tool and utilizing it for new permit projects. However, the DICE model requires the use of meteorology data and detailed exhaust stack data that includes stack height, width, exhaust gas temperature, and exhaust gas velocity to model the pollutant dispersion. The District does not have all this information on hand for older projects and many permit holders require assistance to locate these specifications for their equipment. This requires a coordinated outreach effort and the District has performed this for diesel engines under "Phase-1" of the state's CTR emissions reporting and has begun recalculating risk for additional older projects in anticipation of "Phase 3" reporting.

6. PCBTF Special Attention and Focus

Parachlorobenzotrifluoride (PCBTF) is a specialized chlorinated aromatic solvent that has served as the foundational carrier fluid for the automotive refinishing and industrial coatings industries since the 1960s. Following a formal petition by its original manufacturer, the EPA officially granted PCBTF a VOC-exempt status in October 1994 based on data proving it has a negligible contribution to photochemical smog or tropospheric ozone formation. This environmental exemption quickly transformed PCBTF into a nationwide regulatory compliance tool; manufacturers relied heavily on the solvent to develop low-VOC, high-solids automotive clearcoats, primers, and reducers that met strict regional air quality targets. However, because environmental policies initially prioritized macro-level urban smog reduction over individual localized toxicity, PCBTF's long-term human health impacts were fundamentally under-realized by environmental management structures for nearly twenty-five years.

In 2020, OEHHA finalized an updated Inhalation Unit Risk (IUR) factor for PCBTF. While initially unnoticed, in 2024 the new factor was made readily accessible for use when it was integrated into CARB's HARP2 software**.** This created an immediate regulatory paradox because the updated toxicological factor projected that even the smallest, lowest-volume local paint shops would have a high-priority toxic risk score.

When air districts and state agencies plugged the new factor into a standard automotive spray booth template, they found for a shop utilizing a standard coating containing 50% PCBTF by weight, the mathematical risk modeling mandated that the shop reduce its coating usage by over 95% just to stay below the allowable risk limits. For a standard shop, cutting material throughput by 95% means they could realistically only paint a handful of cars per year. Because there are no commercially viable, source-specific control technologies available to mitigate this mathematical outcome, a rigid application of standard screening algorithms effectively creates a regulatory freeze.

At the time of their baseline permitting and subsequent prioritization reviews, the ten (10) minor automotive refinishing facilities operating within the District were evaluated using standard methodologies and formally designated as low priority risks. Note the first two digits of the permit number indicates the year the operating permit was issued (and no recent permit modifications).

District has 10 permitted facilities that utilize PCBTF compounds.

Facility	Location	Permit
Carrera's Autobody	36 B Mill St., Healdsburg	01-12
Roux's Body and Paint	103 Sandholm Rd., Cloverdale	02-06
Silveira Pontiac Buick GMC	985 Healdsburg Ave., Healdsburg	02-16
M&M Auto Body	44 D St., Healdsburg	02-17
Bill & Gino's Autobody	120 Mill St., Healdsburg	02-19

Healdsburg Collision	20 Healdsburg Ave., Healdsburg	02-20
Cloverdale Collision / Norcal Kustomz	150 Sandholm Rd, Cloverdale	09-13
Cloverdale Eagle Tech Collision	208 North Cloverdale Blvd, Cloverdale	02-15, 05-43, 11-12
G&C Autobody	10661 Old Redwood Hwy, Windsor	10-31, 10-32
Redwood Autobody	200 Kennedy Lane, Healdsburg	06-05, 02-21

While state authorities reconcile these modeling metrics against CalEPA's in-situ lower physical measurements, the District will utilize case-by-case consultations and physical operational tracking for any permit actions related to facilities utilizing PCBTF.

To manage this recent regulatory evolution efficiently, the District is integrating the CARB/CAPCOA "Autobody Coating Emission Calculator" as a bridge tool into its primary evaluation workflows, which utilizes a statewide sales-weighted average coating toxics composition to evaluate baseline facility profiles. Simultaneously, the District is launching an outreach and onboarding campaign for its data management system which natively integrates all structural, temporal, and stack-velocity parameters mandated by the upcoming CARB Criteria Pollutant and Toxic Air Contaminant Reporting (CTR) Phase 3 rule.

The District strongly recommends that planning agencies be aware of the placement of facilities that utilize PCBTF and their proximity to residences and nearby businesses to mitigate chronic exposure risk. Please contact the District with any questions on this matter or the listed facilities, above.

---

7. Control Strategy and Program Enhancements

The District's pollution control strategy in its regulations is effective, including its requirements to install RCT and TBACT emissions controls for toxic pollutants, and it will continue to be implemented in accordance with the District's Hot Spots regulation.

The NSCAPCD has been expending additional staff and fiscal resources to update its Hot Spots risk prioritization scores and to report under the State's annual emissions reporting rule (CTR). As CTR "phases-in" through 2029, the NSCAPCD will end-up providing data for all of its facilities, and updating risk scores. The District is planning to update to a new data management and reporting system at the start of 2027 and it is currently testing the system for inauguration. This system includes a feature that will provide for permit holders to submit facility and emissions data online directly to the District to greatly increase data flow, accessibility, and review for statewide emissions reporting and risk evaluations.

---

8. Conclusion

This report is part of our ongoing commitment to our local air quality and public health. Prioritization and risk scores are built using general mathematical models and exposure factors designed to estimate different types of risk (such as immediate or long-term impacts) for various people in the community, including nearby residents, workers, or someone simply passing by a facility's property line. Because these state-level programs try to be a one-size-fits-all solution across all business types, they can be less than perfect for specific projects and locations.

State, Air Districts, and public interest in toxic air contaminants and their underlying science continues to grow and the actual evaluation frameworks remain complex, highly specialized, and rapidly evolving. If you are reviewing this summary to evaluate a local area or make property, business, or personal decisions, we highly encourage you to reach out to our team for a case-by-case discussion.

Copies of this report were shared at the public noticed meeting and hearing of the District on October 15, 2026. Copies of the report will be sent to county, city, health officer, and available on the District's web site on its "air quality" section, on the "progress reports" page.

Appendix A – Title V "Major Source" Facilities

- These are aggregate scores that include all the permitted equipment at each geothermal electrical generation facility.
- All of the District's Title V facilities are geothermal facilities.
- These scores were calculated with current methodology in 2024.
- These facilities have remote locations and therefore lower risk regarding public exposure.

Company	Facility	Risk	Calculated Risk Score		
			Cancer	Chronic	Acute
Calpine	Aidlin	Low	0.02	0.01	0.01
Calpine	Unit 5&6	Low	0.05	0.41	0.91
Calpine	Unit 12	Low	0.07	0.29	0.65
Calpine	Unit 18	Low	0.08	0.07	0.14
Calpine	Unit 14	Low	0.08	0.07	0.14
Calpine	Unit 20	Low	0.08	0.04	0.07
Calpine	Unit 11	Low	0.13	0.35	0.77
Calpine	Unit 7&8	Low	0.14	0.33	0.67
NCPA	Plant 1	Low	0.15	0.08	0.25
NCPA	Plant 2	Low	0.15	0.09	0.25
Calpine	Unit 3	Low	0.34	0.05	0.07
Calpine	Unit 17	Intermediate	3.42	0.18	0.19

Appendix B – Gasoline Dispensing Facilities

- **(17)** permitted facilities in 2025. **(10)** low and **(7)** intermediate risk prioritization.
- Calculated based on actual reported throughput for CY 2025.
- Gas station proximity to closest residence or worker at another facility provides highest risk values due to chronic exposure.

Permit #	Facility ID	Facility Name	Address	City	Permit Description	Permit Limits	gals/yr	Max Residential Cancer Risk (chances/ million)	Max Worker Cancer Risk (chances /million)	Chronic HI	Acute HI
